Education

University of Florida
Bachelor of Science in Computer Science — Gainesville, FL

- **Graduation with honors - Cum Laude**

Experience

Software Development Engineer in Test, Panasonic — Oct. 2026 - Present
Skills used: Python, Pytest, Appium, Squish, Playwright, GitLab, Linux — Irvine, CA

- Engineered automated test software for airline IFE systems spanning 375+ test cases using Appium, Squish, and Playwright automation stacks through a shared pytest architecture
- Built a crash-recovery subsystem in Python using atexit and signal handlers that restores rack hardware state after killed CI sessions, preventing rack blackouts

Software Development Engineer in Test Intern, Arthrex — Jun. 2026 - Aug. 2026
Skills used: Python, Pytesseract, C#, .NET, Git, Bitbucket, Jenkins, Selenium — Santa Barbara, CA

- Architected and led development of an automated test runner using Python and C# for a medical imaging console, using Pytesseract OCR to validate expected on-screen text results across localized UI screenshots
- Increased automated coverage by 11% for an arthroscopic surgical platform by adding feature-level tests to a shared C#/.NET Selenium automation framework
- Improved nightly regression efficiency by 7.1% by optimizing Jenkins pipelines and integrating reliable headless test execution into CI/CD
- Turned localized UI behavior into repeatable quality signals by validating expected text across languages and producing artifacts engineers could review after nightly runs

Software QA Intern, Arthrex — May 2025 - Aug. 2025
Skills used: C#, .NET, Python, Git, Bitbucket, Jenkins, Selenium, Agile Scrum — Santa Barbara, CA

- Increased regression coverage by 20% by extending a shared C#/.NET Selenium framework for embedded surgical-device releases.
- Improved daily test-pipeline efficiency by 5% by expanding Jenkins automation and reducing manual execution within the validation workflow
- Enabled repeatable remote device testing by building Redis and Selenium-based infrastructure that controlled device state across automated runs
- Built test workflows for medical-device consoles using TCP/IP and SSH to execute automation directly on embedded hardware

Projects

ALAN: Academic Learning Analysis Network — Jan. 2026 - May 2026
Skills used: Python, Bittensor, Hugging Face, Docker, FastAPI, Git

- Developed a decentralized Bittensor subnet implementing miner-validator evaluation to incentivize high-quality academic journal peer reviews
- Deployed and tested a local Subtensor blockchain with Docker, integrating wallet management, subnet registration, and metagraph interactions
- Engineered LLM-powered validator pipelines to score peer reviews using multi-criteria evaluation and on-chain reward distribution
- Built data ingestion pipelines using the OpenReview API to preprocess academic review datasets for model evaluation

Technical Skills

Languages: Python, C#, JavaScript, SQL, HTML/CSS, C++, Batch script
Developer Tools: Git, Jenkins, GitLab, GitHub Actions, Docker, Linux, SSH/ADB, Agile Scrum
Libraries/Frameworks: Pytest, Selenium, Appium, Playwright, Squish, .NET, Pytesseract, REST APIs
Cloud/Platforms: Bittensor, AWS Lambda, API Gateway, DynamoDB, S3
